Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Customer Problem Statement Template

Create a problem statement to understand your customer's point of view and find the ideal solution for the challenges they face.

Filled Problem Statements

PS-1 is the network engineer who submits and fulfills requests (the customer); PS-2 is the IT Operations Manager who owns the process and its outcomes (the business).

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1 (Customer)	A network engineer working in the IT operations team of a large enterprise, handling 20 to 30 network requests every week, ranging from access changes to firewall configurations. Works with multiple teams, reports to IT management, and is responsible for keeping the network secure and available.	Process network requests faster, with proper approval tracking, and full visibility into what stage each request is in - without chasing people for approvals or clarifying incomplete requests.	Requests come in different formats - email, chat, phone, and tickets, and information is often missing or unclear. Approvals happen over email with no audit trail. Tasks are created and assigned manually, and requesters keep following up because they have no visibility.	There is no standard system for capturing network requests, no automated approval workflow, and no centralized tracking. Everything is manual, disconnected, and dependent on people remembering to follow up.	Frustrated, overwhelmed, and undervalued -spending more time coordinating than actually solving network problems, and worried about missing approvals during audits and letting the team down.

PS-2 (Business)	The IT Operations Manager of a large enterprise, overseeing the network team, managing the IT budget, and responsible for ensuring that network changes are compliant, efficient, and well-documented.	Reduce the average time it takes to fulfill network requests, ensure every change has a proper approval trail, and improve SLA compliance across the IT team.	The current process has no standardization - every request is handled differently, approvals are lost in email threads, there is no way to measure request duration or team load, and audit preparation takes weeks.	There is no centralized system for network request management. Everything depends on manual effort and personal follow-up. There is no automation, no reporting, and no audit trail.	Concerned about compliance risks, frustrated by the lack of visibility, and worried that the team is spending too much time on coordination instead of real work.
